

YOG MEHTA

✉ mehtayog2005@gmail.com | [in LinkedIn](#) | [GitHub](#)

EDUCATION

Kishinchand Chellaram (KC)

Bachelor of Vocation in Web Technologies | CGPA: 9.85 / 10

May 2026

Mumbai, Maharashtra

EXPERIENCE

Back End Developer Intern

July 2025 – October 2025

Sort Solution

- Eliminated concurrent booking conflicts for a Hospital Management System by designing atomic Django REST APIs with database-level constraints, achieving 100% scheduling integrity across all concurrent sessions.
- Hardened patient data security by building a 3-tier RBAC system (Admin / Doctor / Patient) using Django permissions, enforcing zero cross-role data leakage across all API endpoints.

PROJECTS

CryptNode Zero-knowledge encrypted chat | Go, WebSockets, React, AES-GCM-256

[GitHub](#)

- Built a zero-knowledge encrypted messaging platform supporting real-time communication, file sharing, and multi-device synchronization by developing a Go relay server and React client architecture.
- Improved application responsiveness during high message volumes by offloading P-256 ECDH key derivation and AES-GCM-256 encryption tasks to parallel Web Workers, preventing main-thread blocking.
- Ensured multi-device state consistency and resolved synchronization conflicts by developing a manifest-based sync engine using Last-Write-Wins (LWW) merge reconciliation.
- Reduced data-at-rest exposure by designing a privacy-focused relay architecture that routes encrypted messages without storing chat content on the server.

StrawVerse | JavaScript, Electron, Node.js, Express.js, Axios, Cheerio

[GitHub](#)

- Optimized bulk video ingestion throughput by 40% by implementing a parallel HLS/M3U8 segment downloader in Node.js that fetches transport stream (TS) segments concurrently and merges them via static FFmpeg.
- Achieved a 99% data extraction success rate across highly restricted web platforms by engineering a resilient, headless scraping engine utilizing hidden Electron BrowserWindow contexts and persistent session cookie management.
- Cut local reader load times from 3.2s to 150ms by building a custom web-based manga reader that streams images directly from zipped archives in base64 format on-the-fly, bypassing disk extraction bottlenecks

Multi-Purpose Discord Automations | Node.js, Discord.js, MongoDB, SQLite, Express.js, Nginx, PM2

[Website](#)

- Reduced bot memory utilization by 70% by configuring strict memory caps on message managers, disabling unnecessary presence caching, and implementing background garbage collection sweepers to purge stale data every 120 seconds.
- Cleared local disk storage footprint to zero by engineering a serverless transcript archiving pipeline that crawled paginated channel histories and utilized Discord channels as secure, cost-free object storage, verifying specific user session permissions prior to granting access.
- Maintained a 99.9% application uptime during production deployments across continuous integration cycles by deploying a VPS infrastructure utilizing Nginx reverse proxying, GitHub webhooks, and PM2

ACHIEVEMENTS

- StrawVerse reached 60+ GitHub stars and 18,000+ YouTube views organically, with zero marketing spend, demonstrating real developer adoption of the open-source tooling.

TECHNICAL SKILLS

- **Languages:** Go, JavaScript, TypeScript, Python, SQL, Java, PHP
- **Frameworks:** Node.js, Express.js, Django, Flask, React, Electron.js, Ionic, WebSockets
- **Databases & Tools:** MySQL, MongoDB, SQLite, Redis, Docker, Nginx, PM2, Git/GitHub, CI/CD, Postman
